AMENDMENTS TO THE CLAIMS:

This listing of claims will replace all prior versions and listings of claims in the application:

Listing of Claims:

- 1. A compressor assembly comprising:
 - a compressor driven by a motor;
- a <u>motor</u> protector for limiting operation of said motor and <u>activated activatable</u> upon a predetermined condition, said motor protector having a switch that limits operation of said motor upon said predetermined condition;

said compressor, said motor and said protector being within a compressor housing; and

a signaling device <u>for signaling</u> the meeting of said predetermined condition to a location outside of said compressor housing <u>wherein activation of said switch activates</u> <u>said signaling device</u>.

- 2. (Cancelled)
- 3. The compressor assembly of Claim $2\underline{1}$ wherein activation of said switch activates said signaling device by diverting power to said signaling device from said motor.
- 4. The compressor assembly of Claim 3 wherein said switch is mounted generally electrically in parallel with said signaling device.
- 5. The compressor assembly of Claim [[4]] wherein when said switch is open, current will flow to said signaling device.

- 6. The compressor assembly of Claim 1 wherein said signaling device comprises a light.
- 7. The compressor assembly of Claim 1 wherein said predetermined condition relates to an overload condition of said compressor.
- 8. The compressor assembly of Claim 1 wherein said signaling device comprise a terminal post.
- 9. The compressor assembly of Claim 1 wherein said compressor is a scroll compressor.
- 10. A scroll compressor comprising:
 - a pair of scroll elements interfitting to define compression chambers;
- a drive shaft driven by an electric motor having a stator and a rotor, said drive shaft causing one of said two scroll members to orbit relative to the other; and
- a motor protector switch mounted in conjunction with a winding of said stator, said motor protector switch including a switch which is selectively opened to stop operation of said electric motor, and a signaling device associated with said motor protector switch to provide a signal external to a compressor housing when said switch is opened.

11-13. (Cancelled)

14. (New) A compressor assembly comprising:

a compressor driven by a motor;

a protector for limiting operation of said motor and activatable upon a predetermined condition;

said compressor, said motor and said protector being within a compressor housing; and

a signaling device for signaling the meeting of said predetermined condition to a location outside said compressor housing, said signaling device comprising a terminal post.

- 15. (New) The compressor assembly of claim 14 wherein said terminal post comprises a first terminal post and a second terminal post.
- 16. (New) The compressor assembly of claim 15 wherein said first terminal post and said second terminal post form a circuit with a switch of said protector, said switch for limiting operation of said motor upon said predetermined condition.
- 17. (New) the compressor assembly of claim 16 wherein said first terminal post and said second terminal post form an open circuit with said switch when said switch is open.
